### State Pattern

- Simulate a TV without using control flow (ie. Use the state pattern)
- Create a Class named TV with no constructor parameters
- The TV must contain the following methods as its API:
  - volumeUp(): Unit
  - volumeDown(): Unit
  - mute(): Unit
  - power(): Unit
  - currentVolume(): Int

- TV is initially off when created
- Initial volume is 5
- When the TV is off:
  - Volume up/down and mute buttons do nothing
  - Current volume is 0
- The power button turns the TV on/off
- Volume up button increases volume by 1 up to a maximum volume of 10
- Volume down button decreases volume by 1 down to minimum volume of 0
- Pressing the mute button mutes/unmutes the TV
- When the TV is muted:
  - Current volume is 0
  - Pressing the mute, volume up, or volume down buttons will unmute the TV and restore the volume to the premute volume (Do not in/decrease the volume)
- When turning the TV back on, the volume should return to its value when the TV was last on
- If the TV was turned off while muted, when it is turned back on it should not be muted

We could write all this behavior without the state pattern

 But we're here for state pattern practice so lets use it

- TV is initially off when created
- Initial volume is 5
- When the TV is off:
  - Volume up/down and mute buttons do nothing
  - Current volume is 0
- The power button turns the TV on/off
- Volume up button increases volume by 1 up to a maximum volume of 10
- Volume down button decreases volume by 1 down to minimum volume of 0
- Pressing the mute button mutes/unmutes the TV
- When the TV is muted:
  - Current volume is 0
  - Pressing the mute, volume up, or volume down buttons will unmute the TV and restore the volume to the premute volume (Do not in/decrease the volume)
- When turning the TV back on, the volume should return to its value when the TV was last on
- If the TV was turned off while muted, when it is turned back on it should not be muted

How to implement these features?

- Write your API
  - What methods will change behavior depending on the current state of the object
  - These methods define your API and are declared in the state abstract class
- Decide what states should exist
  - Any situation where the behavior is different should be a new state
- Determine the transitions between states

- TV is initially off when created
- Initial volume is 5
- When the TV is off:
  - Volume up/down and mute buttons do nothing
  - Current volume is 0
- The power button turns the TV on/off
- Volume up button increases volume by 1 up to a maximum volume of 10
- Volume down button decreases volume by 1 down to minimum volume of 0
- Pressing the mute button mutes/unmutes the TV
- When the TV is muted:
  - Current volume is 0
  - Pressing the mute, volume up, or volume down buttons will unmute the TV and restore the volume to the premute volume (Do not in/decrease the volume)
- When turning the TV back on, the volume should return to its value when the TV was last on
- If the TV was turned off while muted, when it is turned back on it should not be muted

How to implement these features?

- Write your API
  - What methods will change behavior depending on the current state of the object

#### API:

- This API contains methods for all the buttons on the TV, and a method to get the current volume
  - volumeUp()
  - volumeDown()
  - mute()
  - power()
  - currentVolume()

- TV is initially off when created
- Initial **volume** is 5
- When the TV is off:
  - Volume up/down and mute buttons do nothing
  - Current volume is 0
- The power button turns the TV on/off
- Volume up button increases volume by 1 up to a maximum volume of 10
- Volume down button decreases volume by 1 down to minimum volume of 0
- Pressing the mute button mutes/unmutes the TV
- When the TV is muted:
  - Current **volume** is 0
  - Pressing the mute, volume up, or volume down buttons will unmute the TV and restore the volume to the pre-mute volume (Do not in/decrease the volume)
- When turning the TV back on, the volume should return to its value when the TV was last on
- If the TV was turned off while muted, when it is turned back on it should not be muted

How to implement these features?

 Decide what states should exist

### States:

- TV is initially off when created
- Initial volume is 5
- When the TV is off:
  - Volume up/down and mute buttons do nothing
  - Current volume is 0
- The power button turns the TV on/off
- Volume up button increases volume by 1 up to a maximum volume of 10
- Volume down button decreases volume by 1 down to minimum volume of 0
- Pressing the mute button mutes/unmutes the TV
- When the TV is muted:
  - Current volume is 0
  - Pressing the mute, volume up, or volume down buttons will unmute the TV and restore the volume to the premute volume (Do not in/decrease the volume)
- When turning the TV back on, the volume should return to its value when the TV was last on
- If the TV was turned off while muted, when it is turned back on it should not be muted

How to implement these features?

 Decide what states should exist

### States:

- Off <-- Initial State</li>
- On (but not muted)
- Muted

- TV is **initially off** when created
- Initial volume is 5
- When the TV is off:
  - Volume up/down and mute buttons do nothing
  - Current volume is 0
- The power button turns the TV on/off
- Volume up button increases volume by 1 up to a maximum volume of 10
- Volume down button decreases volume by 1 down to minimum volume of 0
- Pressing the mute button mutes/unmutes the TV
- When the TV is **muted**:
  - Current volume is 0
  - Pressing the mute, volume up, or volume down buttons will unmute the TV and restore the volume to the premute volume (Do not in/decrease the volume)
- When turning the TV back on, the volume should return to its value when the TV was last on
- If the TV was turned off while muted, when it is turned back
   on it should not be muted

How to implement these features?

Determine the transitions between states

**State Transitions:** 

- TV is initially off when created
- Initial volume is 5
- When the TV is off:
  - Volume up/down and mute buttons do nothing
  - Current volume is 0
- The power button turns the TV on/off
- Volume up button increases volume by 1 up to a maximum volume of 10
- Volume down button decreases volume by 1 down to minimum volume of 0
- Pressing the mute button mutes/unmutes the TV
- When the TV is muted:
  - Current volume is 0
  - Pressing the mute, volume up, or volume down buttons will unmute the TV and restore the volume to the premute volume (Do not in/decrease the volume)
- When turning the TV back on, the volume should return to its value when the TV was last on
- If the TV was turned off while muted, when it is turned back on it should not be muted

#### How to implement these features?

 Determine the transitions between states

#### **State Transitions:**

- Off -> On
  - Power button pressed
- On -> Off
  - Power button pressed
- On -> Muted
  - Mute button pressed
- Muted -> On
  - Mute, volume up, or volume down button pressed
- Muted -> Off
  - Power button pressed

- TV is initially off when created
- Initial volume is 5
- When the TV is off:
  - Volume up/down and mute buttons do nothing
  - Current volume is 0
- The power button turns the TV on/off
- Volume up button increases volume by 1 up to a maximum volume of 10
- Volume down button decreases volume by 1 down to minimum volume of 0
- Pressing the mute button mutes/unmutes the TV
- When the TV is muted:
  - Current volume is 0
  - Pressing the mute, volume up, or volume down buttons will unmute the TV and restore the volume to the pre-mute volume (Do not in/decrease the volume)
- When turning the TV back on, the volume should return to its value when the TV was last on
- If the TV was turned off while muted, when it is turned back on it should not be muted

Let's visualize the states and transitions in a state diagram

```
class On(theTV: TV) extends TVState(theTV) {
  override def volumeUp(): Unit = {this.tv.volume += 1}
  override def volumeDown(): Unit = {this.tv.volume -= 1}
  override def power(): Unit = {
    this.tv.state = new Off(this.tv)}
class Off(theTV: TV) extends TVState(theTV) {
  override def power(): Unit = {
    this.tv.state = new On(this.tv)
  override def currentVolume(): Int = {0}
abstract class TVState(val tv: TV) {
  def volumeUp(): Unit = {}
  def volumeDown(): Unit = {}
  def mute(): Unit = {}
  def power(): Unit = {}
 def currentVolume(): Int = {this.tv.volume}
class TV {
  var volume = 5
  var state: TVState = new Off(this)
  def volumeUp(): Unit = {this.state.volumeUp()}
  def volumeDown(): Unit = {this.state.volumeDown()}
  def mute(): Unit ={this.state.mute()}
  def power(): Unit = {this.state.power()}
  def currentVolume(): Int ={this.state.currentVolume()}
def main(args: Array[String]): Unit = {
  val tv: TV = new TV()
  tv.volumeUp()
  println(tv.currentVolume())
  tv.power()
  tv.volumeUp()
  println(tv.currentVolume())
```

### Memory Diagram!!

- This code implements a subset of the required features
  - Full solution in the repo

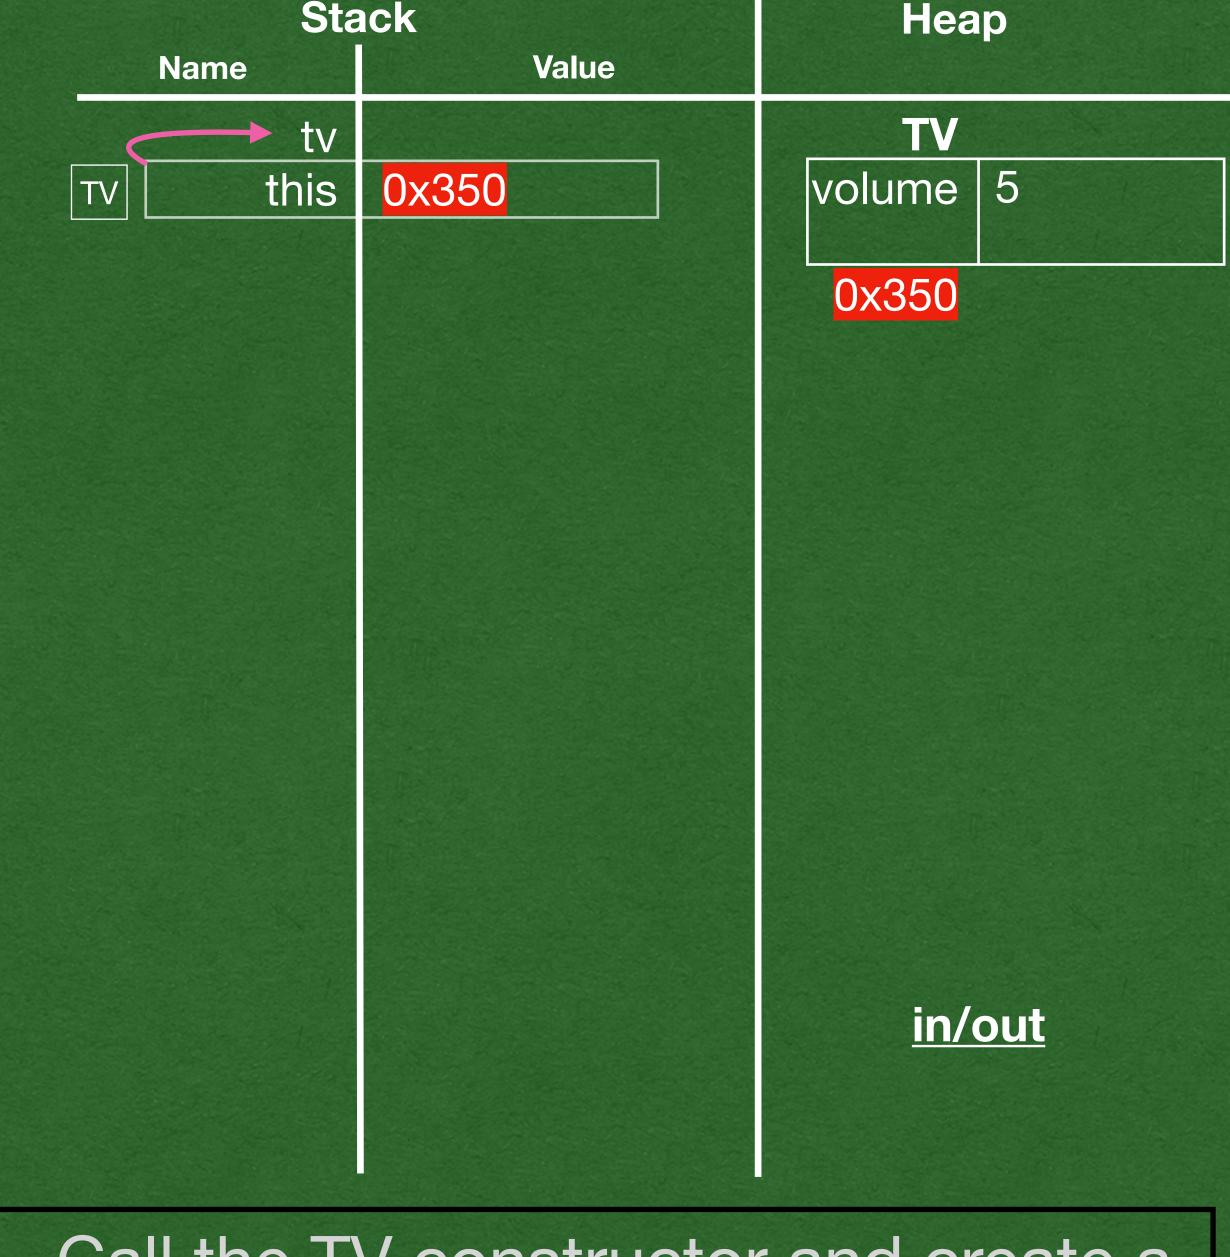

What happens in memory when this program executes?

```
class On(theTV: TV) extends TVState(theTV) {
  override def volumeUp(): Unit = {this.tv.volume += 1}
  override def volumeDown(): Unit = {this.tv.volume -= 1}
  override def power(): Unit = {
    this.tv.state = new Off(this.tv)}
class Off(theTV: TV) extends TVState(theTV) {
  override def power(): Unit = {
    this.tv.state = new On(this.tv)
  override def currentVolume(): Int = {0}
abstract class TVState(val tv: TV) {
  def volumeUp(): Unit = {}
  def volumeDown(): Unit = {}
  def mute(): Unit = {}
  def power(): Unit = {}
  def currentVolume(): Int = {this.tv.volume}
class TV {
  var volume = 5
  var state: TVState = new Off(this)
  def volumeUp(): Unit = {this.state.volumeUp()}
  def volumeDown(): Unit = {this.state.volumeDown()}
  def mute(): Unit ={this.state.mute()}
  def power(): Unit = {this.state.power()}
  def currentVolume(): Int ={this.state.currentVolume()}
def main(args: Array[String]): Unit = {
  val tv: TV = new TV()
  tv.volumeUp()
  println(tv.currentVolume())
  tv.power()
  tv.volumeUp()
  println(tv.currentVolume())
```

```
Stack
                                    Heap
                  Value
Name
                                    in/out
```

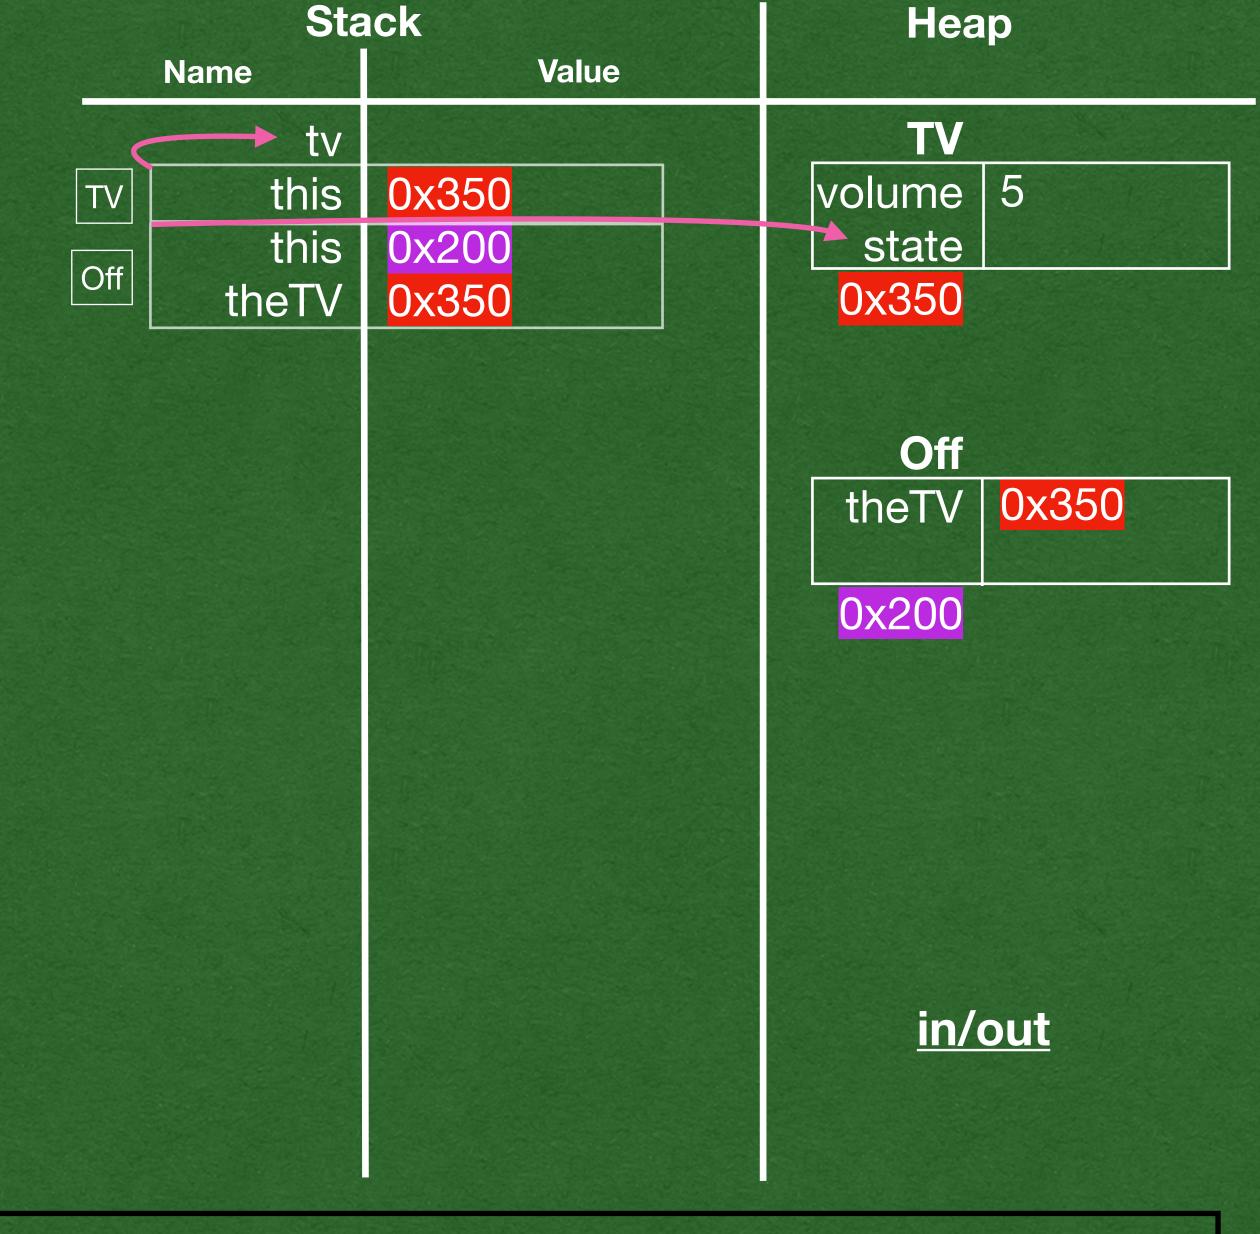

Let's get started!

```
class On(theTV: TV) extends TVState(theTV) {
  override def volumeUp(): Unit = {this.tv.volume += 1}
  override def volumeDown(): Unit = {this.tv.volume -= 1}
  override def power(): Unit = {
    this.tv.state = new Off(this.tv)}
class Off(theTV: TV) extends TVState(theTV) {
  override def power(): Unit = {
    this.tv.state = new On(this.tv)
  override def currentVolume(): Int = {0}
abstract class TVState(val tv: TV) {
  def volumeUp(): Unit = {}
  def volumeDown(): Unit = {}
  def mute(): Unit = {}
  def power(): Unit = {}
  def currentVolume(): Int = {this.tv.volume}
class TV {
  var volume = 5
  var state: TVState = new Off(this)
  def volumeUp(): Unit = {this.state.volumeUp()}
  def volumeDown(): Unit = {this.state.volumeDown()}
  def mute(): Unit ={this.state.mute()}
  def power(): Unit = {this.state.power()}
  def currentVolume(): Int ={this.state.currentVolume()}
def main(args: Array[String]): Unit = {
  val tv: TV = new TV()
  tv.volumeUp()
  println(tv.currentVolume())
  tv.power()
  tv.volumeUp()
  println(tv.currentVolume())
```

Call the TV constructor and create a TV object

```
class On(theTV: TV) extends TVState(theTV) {
  override def volumeUp(): Unit = {this.tv.volume += 1}
  override def volumeDown(): Unit = {this.tv.volume -= 1}
  override def power(): Unit = {
    this.tv.state = new Off(this.tv)}
class Off(theTV: TV) extends TVState(theTV) {
  override def power(): Unit = {
    this.tv.state = new On(this.tv)
  override def currentVolume(): Int = {0}
abstract class TVState(val tv: TV) {
  def volumeUp(): Unit = {}
  def volumeDown(): Unit = {}
  def mute(): Unit = {}
  def power(): Unit = {}
  def currentVolume(): Int = {this.tv.volume}
class TV {
  var volume = 5
  var state: TVState = new Off(this)
  def volumeUp(): Unit = {this.state.volumeUp()}
  def volumeDown(): Unit = {this.state.volumeDown()}
  def mute(): Unit ={this.state.mute()}
  def power(): Unit = {this.state.power()}
  def currentVolume(): Int ={this.state.currentVolume()}
def main(args: Array[String]): Unit = {
 val tv: TV = new TV()
  tv.volumeUp()
  println(tv.currentVolume())
  tv.power()
  tv.volumeUp()
  println(tv.currentVolume())
```

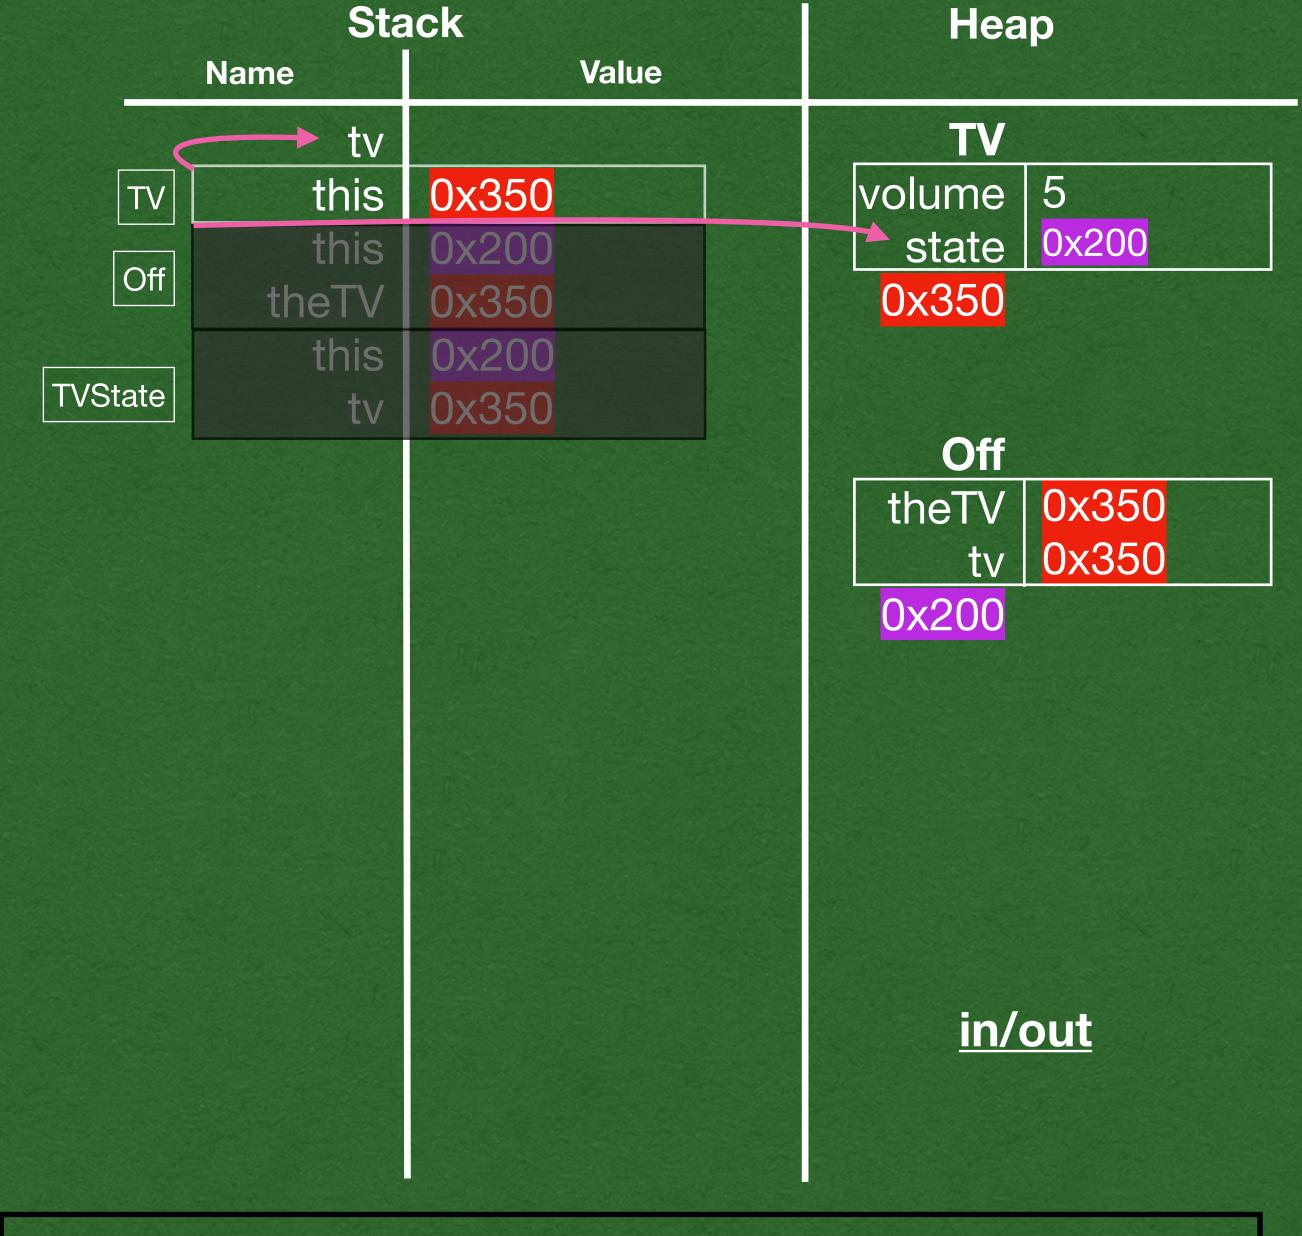

- The TV constructor creates a Off object
- Calls the Off constructor, but not through inheritance

```
class On(theTV: TV) extends TVState(theTV) {
                                                                              Stack
                                                                                                            Heap
  override def volumeUp(): Unit = {this.tv.volume += 1}
                                                                                         Value
                                                                      Name
  override def volumeDown(): Unit = {this.tv.volume -= 1}
 override def power(): Unit = {
                                                                             tv
   this.tv.state = new Off(this.tv)}
                                                                                                        volume | 5
                                                                            this 0x350
                                                                            this 0x200
                                                                                                          state
class Off(theTV: TV) extends TVState(theTV) {
                                                                  Off
                                                                                                         0x350
  override def power(): Unit = {
                                                                         theTV
                                                                                 0x350
   this.tv.state = new On(this.tv)
                                                                                 0x200
                                                                            this
                                                               TVState
                                                                                 0x350
                                                                              tv
 override def currentVolume(): Int = {0}
                                                                                                            Off
                                                                                                         theTV 0x350
abstract class TVState(val tv: TV) {
 def volumeUp(): Unit = {}
                                                                                                             tv 0x350
  def volumeDown(): Unit = {}
                                                                                                         0x200
  def mute(): Unit = {}
  def power(): Unit = {}
 def currentVolume(): Int = {this.tv.volume}
class TV {
 var volume = 5
  var state: TVState = new Off(this)
  def volumeUp(): Unit = {this.state.volumeUp()}
  def volumeDown(): Unit = {this.state.volumeDown()}
  def mute(): Unit ={this.state.mute()}
  def power(): Unit = {this.state.power()}
                                                                                                             in/out
  def currentVolume(): Int ={this.state.currentVolume()}
def main(args: Array[String]): Unit = {
 val tv: TV = new TV()
  tv.volumeUp()
  println(tv.currentVolume())
                                                                Off constructor calls the TVState constructor
  tv.power()
  tv.volumeUp()
 println(tv.currentVolume())
                                                                This call is due to inheritance
```

```
class On(theTV: TV) extends TVState(theTV) {
                                                                              Stack
                                                                                                             Heap
  override def volumeUp(): Unit = {this.tv.volume += 1}
                                                                                          Value
                                                                       Name
  override def volumeDown(): Unit = {this.tv.volume -= 1}
  override def power(): Unit = {
                                                                             tv
   this.tv.state = new Off(this.tv)}
                                                                                                        volume | 5
                                                                            this 0x350
                                                                            this 0x200
                                                                                                          state
class Off(theTV: TV) extends TVState(theTV) {
                                                                  Off
  override def power(): Unit = {
                                                                                                         0x350
                                                                          theTV
                                                                                  0x350
   this.tv.state = new On(this.tv)
                                                                            this
                                                                                  0x200
                                                               TVState

                                                                With the TV in the On state, currentVolume
 tv.power()
 tv.volumeUp()
                                                                returns the volume of the TV
 println(tv.currentVolume())
```

### State Pattern - Closing Thoughts

### State pattern trade-offs

#### Pros

- Organizes code when a single class can have very different behavior in different circumstances
- Each implemented method is only concerned with the reaction to 1 event (API call) in 1 state
- Easy to change or add new behavior after the state pattern is setup

#### Cons

- Can add complexity if there are only a few states or if behavior does not change significantly across states
- Spreading the behavior for 1 class across many classes can look complex and require clicking through many files to understand all the behavior

### State Pattern - Closing Thoughts

- Do not use the state pattern everywhere
  - Decide if a class is complex enough to benefit from this pattern before applying it

- The state pattern in this class
  - I have to force you to use it by removing conditionals (Not realistic)
  - Used to reinforce your understanding of inheritance and polymorphism
  - Used as an example of a design pattern that can help organize your code
- When you're not forced to use this pattern
  - Weight the pros and cons to decide when it is the best approach
